

AMENDMENTS

In the Claims

The following is a copy of Applicant's claims that identifies language being added with underlining ("___") and language being deleted with strikethrough ("—"), as is applicable:

1. (Currently Amended) A system for identifying and extracting text in a distributed processing environment, comprising:

a client computer coupled to a network and including a browser;

a server computer coupled to the network, the server computer being operative to provide web content to the client computer via the browser; and

information associated with a user of the client computer,

wherein a destination service presented by the server computer to the [[user]] client computer obtains portions of text in the information such that the text is used to modify the web content for presentation to the user via the browser.

2. (Original) The system of claim 1, wherein the text is extracted from the information using optical character recognition.

3. (Original) The system of claim 1, wherein the text is represented by a text rendition of an internal representation of an indicated region of the text.

4. (Original) The system of claim 1, wherein the information associated with the user of the client computer is graphical information that includes textual information.

5. (Original) The system of claim 4, wherein the graphical information is identified using a uniform resource locator (URL).

6. (Currently Amended) The system of claim 1, wherein the information is specific to a user of the [[first]] client computer.

7. (Currently Amended) The system of claim 1, wherein the information resides on the [[first]] client computer.

8. (Currently Amended) The system of claim 1, wherein the information resides remote from the [[first]] client computer.

9. (Original) The system of claim 1, wherein the destination service uses a code portion in the browser to obtain the portions of text in the information.

10. (Original) The system of claim 1, wherein the destination service uses the server to directly access and obtain the portions of text in the information.

11. (Original) The system of claim 1, wherein the portions of text in the information are used to complete a web page form.

12. (Currently Amended) A method for identifying and extracting text in a distributed processing environment, the method comprising:

coupling a client computer to a network, the client computer including a browser;

coupling a server to the network;

associating information with a user of the client computer; and

obtaining portions of text in the information using a destination service presented by the server computer to the [[user]] client computer such that web content presented to the user via the browser is modified using the text obtained from the information.

13. (Original) The method of claim 12, wherein the text is extracted from the information using optical character recognition.

14. (Original) The method of claim 12, further comprising:
representing the text as a text rendition of an internal representation of an indicated region of the text; and
directly extracting the text rendition.

15. (Original) The method of claim 12, wherein the information associated with the user is graphical information that includes textual information.

16. (Original) The method of claim 15, further comprising identifying the graphical information using a uniform resource locator (URL).

17. (Currently Amended) The method of claim 12, wherein the information is specific to a user of the [[first]] client computer.

18. (Currently Amended) The method of claim 12, wherein the information resides on the [[first]] client computer.

19. (Currently Amended) The method of claim 12, wherein the information resides remote from the [[first]] client computer.

20. (Original) The method of claim 12, wherein the portions of text in the information are obtained using a code portion in the browser.

21. (Original) The method of claim 12, wherein the server directly accesses and obtains the portions of text in the information.

22. (Original) The method of claim 12, further comprising using the portions of text in the information to complete a web page form.

23. (Currently Amended) A computer readable medium having a program for identifying and extracting text in a distributed processing environment, the program comprising logic for:

coupling a client computer to a network, the client computer including a browser;

coupling a server to the network;

associating information with a user of the client computer; and

obtaining portions of text in the information using a destination service presented by the server computer to the [[user]] client computer such that web content presented to the user via the browser is modified using the text obtained from the information.

24. (Original) The program of claim 23, wherein the text is extracted from the information using optical character recognition.

25. (Original) The program of claim 23, further comprising:
logic for representing the text as a text rendition of an internal representation of an indicated region of the text; and
logic for directly extracting the text rendition.

26. (Original) The program of claim 23, wherein the information associated with the user is graphical information that includes textual information.

27. (Original) The program of claim 26, further comprising logic for identifying the graphical information using a uniform resource locator (URL).

28. (Currently Amended) The program of claim 23, wherein the information is specific to a user of the [[first]] client computer.

29. (Currently Amended) The program of claim 23, wherein the information resides on the [[first]] client computer.

30. (Currently Amended) The program of claim 23, wherein the information resides remote from [[first]] client computer.

31. (Original) The program of claim 23, wherein the portions of text in the information are obtained using a code portion in the browser.

32. (Original) The program of claim 23, wherein the server directly accesses and obtains the portions of text in the information.

33. (Original) The program of claim 23, further comprising logic for using the portions of text in the information to complete a web page form.

34. (New) The system of claim 1, wherein:
the web content comprises an address that is to be provided by the user; and
the destination service obtains the address by searching the information for a graphical representation of an envelope comprising the address.

35. (New) The method of claim 12, wherein:
the content comprises an address that is to be provided by the user; and
obtaining comprises searching the information for a graphical representation of an envelope comprising the address.

36. (New) The program of claim 23, wherein:
the web content comprises an address that is to be provided by the user; and
the logic for obtaining comprises logic for searching the information for a
graphical representation of an envelope comprising the address.
